

Judicial Itineraries (JI) — Data Dependencies

Inbound and outbound data dependencies of the JI system

This document catalogues JI's data dependencies on other systems, in both directions:

- **Inbound** — data that JI relies on to function correctly, and the source system that data should originate from.
- **Outbound** — data that JI produces and delivers to external systems and consumers.

The analysis is grounded only in the input documents listed under [Source Documents](#). Where the source documentation describes a *gap* — data that ought to come from another system but is currently captured manually — this is flagged explicitly so the dependency stays visible even when the integration is not implemented today.

At a Glance

The table below is a compact summary of every flow described in this document. Each row corresponds to a numbered detail section under [Inbound dependencies](#), [Platform dependencies](#) or [Outbound dependencies](#); each detail section repeats the same compact summary in an [Attribute / Detail](#) table for ease of reference.

#	External System	Data Type	Data	Mechanism
1	Inbound — eLinks (Judicial Database)	Master / reference	Judge identity, roles, payroll, tickets	Manual copy by RSU
2	Inbound — HR Systems	Master / reference	Working patterns, sitting days	Manual copy by RSU
3	Inbound — Listing Systems (CaseMan, FamilyMan, Common Platform)	Operational	Daily planned activity	Manual copy by court staff
4	Inbound — JFEPS / LIBERATA (reconciliation)	Financial reconciliation	Payment status, discrepancies	Manual flagging
5	Platform — OPT / Oracle APEX	Runtime services	APEX runtime, auth, session, JS/CSS	Hosted on platform
6	Platform — HMCTS Email Infrastructure	Notifications & document distribution	Itineraries, alerts, payment files	Email transport
7	Outbound — JFEPS / LIBERATA (payment files)	Financial / transactional	Fee-paid payment schedule	JFEPS Excel via email + manual forward
8	Outbound — DA&I	Aggregated MI	Sittings, utilisation, MI rollups	Direct extract by DA&I

Data flow overview

Diagram 1

The visual signal is deliberate: solid arrows represent the two outbound flows that are real, automated extracts; the six dashed arrows on the inbound and platform sides are all either manually-routed or platform-runtime dependencies. JI is a heavy net consumer of manually-copied data and a much narrower automated producer.

Inbound dependencies

These are flows where JI is the **consumer** — data originates outside JI and must be received for JI to do its job.

The diagram below traces each inbound source through the human actors that move the data and into the JI screens that consume it. Every inbound arrow is dashed because none of the four sources is a real system-to-system integration today; each one depends on a person re-keying or flagging data into JI.

Diagram 2

1. eLinks (Judicial Database)

eLinks is the HMCTS judiciary master-data system (also referred to in the source documents as the *Judicial Database*) and the intended upstream source of judge identity, role, ticket and contact information for JI. NFR-3 requires JI to support an eLinks integration for importing judiciary data, but no system-to-system route is built today — judge details are transcribed manually into JI’s *Manage Judges* screens.

Attribute	Detail
Source system	eLinks (Judicial Database). NFR-3 names eLinks as the integration point; the Training Brief refers to the system as “the Judicial Database” and notes a replacement is “currently being developed”.
Direction	Inbound — JI consumes
Data type	Master / reference data
Data items	Judge name and title; appointment / role details; tickets and authorisations; payroll number; retirement date; contact details
Mechanism	RSU and judicial team users transcribe judge details from the Judicial Database into JI’s <i>Manage Judges</i> screens (contact details, role-specific details, ticket information). NFR-3 specifies a future eLinks integration but it has not been implemented.
Frequency	On change (per judge appointment, retirement, ticket update or contact-detail update)
Status	Manual copy
Criticality	High — judge identity, payroll number and authorised tickets are foundational to itineraries, fee-paid bookings and payments. JI’s inconsistent name format (“Bloggs, J” vs “HHJ Joe Bloggs”) makes cross-system linkage with the Judicial Database difficult and is called out as a known data-quality issue.

Sources: *Judicial Itineraries High Level Requirements* (Integrations As-Is — Judiciary Data (eLinks); NFR-3); *OPT JI Training Brief DRAFT 02* (§5.3 Editing contact details for a Judge); *2026.01.29 Comments from JI Project Team* (§8 — JI uses inconsistent name formats).

2. HR Systems

HR Systems (HMCTS HR records and equivalent administrative records) hold the agreed working arrangements for salaried judges — contractual sitting days, part-time arrangements, jurisdictional split. JI is explicitly *not* the system of record for these arrangements; the working pattern in JI reflects what has already been agreed in HR.

Attribute	Detail
Source system	HR systems / administrative records (HMCTS)
Direction	Inbound — JI consumes
Data type	Master / reference data
Data items	Contractual sitting days; agreed working pattern (days, locations, work types); part-time arrangements; jurisdictional split
Mechanism	RSU users obtain working arrangements from HR systems / administrative records and enter them into JI's <i>Manage Judges</i> → <i>Working Patterns</i> tab as the working pattern. No automated feed exists.
Frequency	On change (typically annual or when a judge moves to part-time, changes base court or has their jurisdictional split adjusted)
Status	Manual copy
Criticality	High — working patterns drive auto-generation of itineraries, sitting targets, part-time fee calculations and downstream MI on judicial utilisation.

Sources: *JI Functional and Non Functional Requirements* (§5.1.2 Assumptions — system of record for HR / working patterns; §5.3.3 Dependencies — HR / administrative records).

3. Listing Systems (CaseMan, FamilyMan, Common Platform)

Listing Systems is the umbrella term used by the Comments document for the case-management and listing systems that hold the operational plan for a court day — *CaseMan*, *FamilyMan* and *Common Platform* in the Civil, Family and Crown jurisdictions JI currently covers. The HLR document explicitly states that no system-to-system integration with these systems exists today; planned activity is transcribed by court staff (or, where there is no listing data to hand, entered directly).

Attribute	Detail
Source system	Listing systems — CaseMan, FamilyMan, Common Platform (case-management / listing systems)
Direction	Inbound — JI consumes
Data type	Operational / transactional
Data items	Daily planned judicial activity (court / venue, work type to be undertaken, session length and AM / PM split)
Mechanism	Court / judicial staff copy daily plan information from the relevant listing system into JI sittings and itineraries (via the Court Itinerary, Judge Itinerary and Sittings screens), or enter it directly where no listing data is available. The planned day is later confirmed as the actual after the sitting takes place.
Frequency	Daily (operational planning cadence)

Attribute	Detail
Status	Manual copy
Criticality	High — accurate daily activity is the basis for utilisation reporting, confirmed sitting counts and (for fee-paid) payments. The lack of integration is the largest single source of manual effort in JI's day-to-day use.

Sources: *2026.01.29 Comments from JI Project Team* (§4 — daily plan “copied from listing systems or entered manually”); *Judicial Itineraries High Level Requirements* (Integrations As-Is — opening paragraph rules out integration with CaseMan, FamilyMan and Common Platform).

4. JFEPS / LIBERATA — reconciliation return leg

The reconciliation step is the return leg of the outbound payment-schedule flow (entry 7). Once the supplier-administered finance system (referred to in the source documents as both *JFEPS* / *JFEBS* and *LIBERATA*) has processed payments, finance and RSU users flag the corresponding bookings in JI's *Payment Reconciliation* screen as paid, pending, or queried. This is recorded as a separate inbound entry rather than collapsed into the outbound payment flow because the data movement and the human pathway are different.

Attribute	Detail
Source system	JFEPS / JFEBS finance system (also referred to as LIBERATA) — destination of the outbound schedule, acting here in its return-leg role
Direction	Inbound — JI consumes (return leg of JFEPS / LIBERATA payment files)
Data type	Financial reconciliation
Data items	Payment status (paid / pending / queried); payment date; mismatch and discrepancy notes
Mechanism	Finance / RSU users mark the corresponding payments as reconciled in JI's <i>Payment Reconciliation</i> screen once finance confirmation is received. Mismatches and manual adjustments may be captured as reconciliation notes. There is no automated feed of finance status into JI.
Frequency	Per payment cycle (typically weekly, aligned with the outbound payment schedule)
Status	Manual copy
Criticality	High — without reconciliation, JI cannot confirm that fee-paid bookings have been correctly paid; double-submission of payments and unreconciled discrepancies could otherwise go undetected.

Sources: *JI Functional and Non Functional Requirements* (§4.8c REC-FR-04, REC-FR-05 — reconciliation against data received from JFEPS/JFEBS, manually flagged); *Judicial Itineraries High Level Requirements* (HLR-28 Payment Reconciliation).

Platform dependencies

These are runtime / transport dependencies — services JI cannot run without, but which do not exchange business data with it in the way an inbound or outbound integration does.

5. OPT / Oracle APEX

OPT (One Performance Truth) is the Oracle APEX-based platform that hosts JI alongside its sibling applications (*OPT Data*, *OPT BMS*, *CAFe*, *CMS*). JI depends on OPT for its runtime, authentication, session management and shared front-end assets. The platform's unsupported state is the principal driver for the JI replacement project.

Attribute	Detail
Platform	OPT (One Performance Truth) suite running on Oracle APEX
Direction	Platform — JI runs on it
Data type	Runtime services
Data items	Oracle APEX runtime; authentication; session timeout management; shared JavaScript / CSS assets (<code>opt.common.js</code> , <code>opt.ji.js</code>); standard APEX page templates and success / error message regions
Mechanism	JI is implemented as an Oracle APEX application within the OPT suite. Page rendering, authentication and session handling are provided by APEX; users reach JI via the OPT Portal.
Frequency	Continuous (every page load)
Status	Implemented (automated)
Criticality	Critical — JI cannot run without OPT / APEX. The KB document and HLR both identify the unsupported platform as the primary driver for replacement.

Sources: *JI Functional and Non Functional Requirements* (§5.2.1 Constraints — Technology platform; §5.3.4 Dependencies — OPT / APEX platform services); *Judicial Itinerary KB* (Background paragraph).

6. HMCTS Email Infrastructure

JI relies on **HMCTS email infrastructure** for both interactive notifications (booking confirmations, absence acknowledgements, itinerary changes) and document distribution (itineraries to judges, payment-schedule files to Payment Authorisers). The payment-schedule transmission to the Authoriser is email-based rather than a finance-system integration, so email availability is load-bearing for the payment flow.

Attribute	Detail
Platform	HMCTS email infrastructure
Direction	Platform — JI uses it as a transport
Data type	Notifications & document distribution
Data items	Itinerary emails to judges and clerks; booking confirmations; absence acknowledgements; cancellation / rejection notifications; payment-schedule emails to Payment Authorisers (with JFEPS Excel attached)
Mechanism	JI sends mail through HMCTS email infrastructure on user-driven and system-triggered events. Payment files are emailed as attachments rather than transferred via a finance integration.
Frequency	Event-driven (per booking, absence, itinerary change, payment cycle)
Status	Implemented (automated)
Criticality	High — both the operational notification flows and the routing of the payment schedule to Authorisers depend on HMCTS email. Bounced or undelivered mail breaks the payment-routing chain.

Sources: *Judicial Itineraries High Level Requirements* (Integrations As-Is — Email and Notifications); *JI Functional and Non Functional Requirements* (§5.3.2 Dependencies — Email infrastructure).

Outbound dependencies

These are flows where JI is the **producer** — data originates inside JI and is delivered to a downstream system or consumer.

The diagram below traces JI's outbound payloads through the human actors that handle them and into each destination. The fee-paid payment schedule routes through a Payment Authoriser who forwards / uploads the file into the supplier-administered finance system (JFEPS / LIBERATA); the DA&I extract is treated by the source documents as a direct data-extraction process even though the precise transport is not described.

Diagram 3

7. JFEPS / LIBERATA (Finance System) — payment files

JFEPS / LIBERATA is the supplier-administered finance system used by HMCTS to process payments for fee-paid judicial work. JI generates a JFEPS-compatible Excel payment schedule from confirmed fee-paid bookings, validates it, and emails the file to a designated Payment Authoriser. The Authoriser reviews the file and forwards / uploads it into the finance system; the source documents are explicit that JI itself does not transmit directly to LIBERATA.

Attribute	Detail
Destination system	JFEPS / JFEBS (also referred to as LIBERATA — the supplier-administered payments platform)
Direction	Outbound — JI produces
Data type	Financial / transactional
Data items	Confirmed fee-paid bookings (judge, court, date, session, work type, booking type); judge payroll number; per-row identifiers for the payment record
Format	JFEPS-compatible Excel file (.xlsx), attached to an email message
Mechanism	JI generates the Excel payment schedule from confirmed fee-paid bookings, validates fields (dates, court codes, booking IDs), and emails the file to a Payment Authoriser. The Authoriser reviews the file and forwards / uploads it to the LIBERATA / JFEPS finance system.
Frequency	Weekly (most fee payments are processed weekly per the Training Brief)
Status	Implemented (automated)
Criticality	Critical — fee-paid judges cannot be paid without this flow. The Excel-plus-email schedule is the primary operational path for fee-paid remuneration; it is paired with the JFEPS / LIBERATA reconciliation return leg for after-the-fact matching.

Sources: *Judicial Itineraries High Level Requirements* (Integrations As-Is — Finance / Judicial Payments (JFEPS); HLR-26, HLR-27); *Jl Functional and Non Functional Requirements* (§2.2 Key Data Concepts — Payment Export; §4.7a FPB-FR-08; §4.8a Payments); *OPT Jl Training Brief DRAFT 02* (§8.1 Confirming payments and producing the payment schedule).

8. DA&I (Data, Analysis & Insight)

DA&I (HMCTS Data, Analysis & Insight) is the team that built and continues to operate Jl's data layer for management-information purposes. It extracts Jl data and transforms it into MI feeding HMCTS performance reporting. The Capabilities document explicitly lists "Provide data to DA&I for reporting and analytics" as a Data Integration & External Consumption capability, although the precise transport is not documented in the source materials.

Attribute	Detail
Destination system	DA&I (HMCTS Data, Analysis & Insight) — the team / data-platform that produces management information from Jl data
Direction	Outbound — Jl produces
Data type	Aggregated MI
Data items	Confirmed sittings; bookings; absences; vacancies; utilisation statistics; planned vs actual sitting day rollups across regions and jurisdictions
Format	Unknown — source documents do not describe the transport (likely direct database extract given DA&I built and operate Jl on the OPT platform)
Mechanism	DA&I extracts Jl data and transforms it into management information feeding HMCTS performance reporting. The Capabilities document positions this as a recurring Data Integration & External Consumption capability rather than a user-driven Excel export.
Frequency	Recurring (aligned with HMCTS reporting cycles); exact cadence not specified in source documents
Status	Implemented (automated)
Criticality	High — DA&I outputs feed annual sitting-day allocations, ministerial reporting, the One Performance Truth platform and broader HMCTS performance discussions. Loss of this flow would be an MI gap rather than an operational outage.

Sources: *High level Capabilities Jl* (§"User Groups and Stakeholders" — DA&I role; §3.7 Data Integration & External Consumption); *Judicial Itinerary KB* (Background paragraph — DA&I aggregates planned and actual sittings into MI).

Summary

- Of the eight catalogued flows, six are inbound or platform and two are outbound — Jl is a heavy net consumer of data brought in by people, and a much narrower automated producer.
- All four inbound flows ([eLinks](#), [HR Systems](#), [Listing Systems](#), [JFEPS / LIBERATA reconciliation](#)) are Manual copy . There are no real system-to-system inbound integrations today; the only stated NFR for an inbound integration (NFR-3, eLinks) is not implemented.

- The most operationally critical end-to-end chain is fee-paid payments: [HR Systems](#) → JI working patterns → JI fee-paid bookings & sittings → [JFEPS / LIBERATA payment files](#) → [JFEPS / LIBERATA reconciliation](#). Three of the four links are manual; only the JI-internal payment-file generation is automated.
- The two platform dependencies are both load-bearing: [OPT / Oracle APEX](#) is the (unsupported) runtime that drives the replacement project, and [HMCTS Email Infrastructure](#) is what carries the fee-paid payment schedule to the Payment Authoriser.
- The largest stated gap is the absence of any direct integration with case-management / listing systems (CaseMan, FamilyMan, Common Platform). The reliance on court staff transcribing the daily plan into JI is the single biggest source of manual effort and the dominant data-quality risk.

Appendix

- **JFEPS / LIBERATA appears twice in the catalogue** (entries 4 and 7). The outbound payment schedule and the inbound reconciliation status travel different paths and have different mechanisms — splitting them keeps both data flows visible and lets each carry its own `Mechanism`, `Frequency` and `Criticality`.
- **eLinks and the Judicial Database are treated as one canonical system.** The Training Brief refers to “the Judicial Database (and especially its replacement, which is currently being developed)”; NFR-3 names the replacement as eLinks. They are aliases for the same upstream master-data system at different points in its lifecycle.
- **CaseMan, FamilyMan and Common Platform are aliased under “Listing Systems”.** The HLR explicitly rules out direct integration with all three; the Comments document collectively refers to them as “listing systems”. A single catalogue entry covers the manual transcription path while the alias map records the named systems.
- **Internal user roles are not catalogued.** Court staff, RSU users, judicial team users, judges and Payment Authorisers are *users of JI*, not external systems. Where their data entry transcribes information from a named upstream system, the upstream system is the dependency (e.g. eLinks, HR Systems, Listing Systems, JFEPS / LIBERATA reconciliation).

Source Documents

This analysis is based **only** on the following documents in `ji-input-docs/` (top-level files; subfolders not consulted):

- `2026.01.29 Comments from JI Project Team_Judicial Itineraries Actuals Project v2 (003).docx`
- `High level Capabilities JI.docx`
- `JI Functional and Non Functional Requirements.docx`

- Judicial Itineraries High Level Requirements.docx
- Judicial Itinerary KB.docx
- OPT JI Training Brief DRAFT 02.doc

The presentation file Draft – HMCTS Actuals Recs – to be agreed v2.pptx is at the top level of the input folder but .pptx is not a supported source-document type for this skill's distillation pipeline; it has been skipped and is not part of this analysis.

Plain-text extractions of the supported documents were produced alongside the input folder at ji-input-docs/output/extracted-text/ and used as the basis of analysis without loading the binary documents into memory.
