

Judicial Itineraries (JI) Integration Dependencies

Data flows between JI and external systems across HMCTS

JI is largely a standalone system with **limited direct integrations**. Most data exchange is file-based (Excel exports) or email-based rather than API-driven. The system both consumes and produces data critical to HMCTS judicial operations.

At a Glance

#	Flow	Source	Destination	Mechanism	Freq.	Crit.
1	Judge Master Data	eLinks, HR Records	JI	Manual entry	On change	High
2	Planned Activity	Listing Systems	JI	Manual copy	Daily	Medium
3	Sitting Confirmation	Court Staff	JI	JI UI entry	Daily	High
4	Absence & Vacancy	Courts, RSU	JI	JI workflow	Event	High
5	Payment Export	JI	JFEPS, Liberata	Excel + email	Weekly	Critical
6	Reconciliation	JFEPS	JI	Manual flagging	Ongoing	Medium
7	MI & Reporting	JI	DA&I	Excel/PDF export	Cycles	High
8	Notifications	JI	HMCTS Email	Automated email	Event	High

Flow Index

1. Judge Master Data (eLinks / HR → JI)
2. Planned Activity Capture (Listing Systems → JI)
3. Sitting & Booking Confirmation (Court Staff → JI)
4. Absence & Vacancy Management (Courts / RSU → JI)
5. Fee-Paid Payment Export (JI → JFEPS → Liberata)
6. Payment Reconciliation (JFEPS → JI)
7. Management Information & Reporting (JI → DA&I)
8. Notifications & Communications (JI → HMCTS Email)

Flow 1 -- Judge Master Data (eLinks / HR → JI)

Judge profile and working pattern data originates in external HR systems and the eLinks Judicial Database, and is manually entered into JI by RSU users. JI is not the system of record for judge employment data; it reflects what has been agreed elsewhere.

Sources	eLinks (Judicial Database), HR / administrative records
Destination	JI (Manage Judges screens)
Data	Judge names, titles, contact details, judge type (salaried / fee-paid), base location, roles, authorisations, tickets, working patterns (days, locations, work types), contractual sitting days, part-time arrangements, jurisdictional split, retirement dates, payroll numbers, fee payment status
Mechanism	Manual entry by RSU / judicial team users. The SRS states an eLinks integration requirement (NFR-3) but the technical mechanism is not implemented.
Frequency	On change -- new judge onboarding, base court transfers, part-time conversions, role updates
Users	RSU Admin, Regional (Full Access) users
Criticality	High -- all itineraries, bookings, and reports depend on accurate judge data

Gap: There is no automated synchronisation. Users must manually keep both eLinks and JI updated. The training documentation notes this will be revisited once the Judicial Database replacement is complete.

Flow 2 -- Planned Activity Capture (Listing Systems → JI)

Data on how judges plan to spend their working day is sourced from court listing systems and entered into JI manually. There is no direct integration with case management systems (CaseMan, FamilyMan, Common Platform).

Source	Court listing systems
Destination	JI (Sittings, Judge Itinerary screens)
Data	Planned sittings, work types (Crime, Civil, Family, S9, Off Circuit), session durations (full day / half day AM/PM), sitting locations
Mechanism	Manual copy from listing systems into JI by HMCTS court staff. Ad-hoc sittings can also be created directly in JI.
Frequency	Daily (progressive entry recommended)
Users	Court (Full Access), Regional (Full Access)
Criticality	Medium -- feeds into utilisation reporting once confirmed

Gap: No system-to-system integration exists. The documentation explicitly states no direct integration with CaseMan, FamilyMan, or Common Platform.

Flow 3 -- Sitting & Booking Confirmation (Court Staff → JI)

After a sitting or fee-paid booking occurs, court staff confirm it in JI -- verifying that it took place, recording the actual work type, and adjusting the session duration if needed. Confirmed data drives both payment processing and MI reporting.

Source	Court staff (local knowledge of what actually happened)
Destination	JI (Sittings, Fee-paid Bookings screens)
Data	Confirmation status (confirmed / cancelled / rejected), actual work type, actual session duration, verifier sign-off (County Courts)
Mechanism	Manual entry via JI UI. Sittings can be confirmed individually or in bulk. County Courts have an additional verification step by a senior manager.
Frequency	Daily (strongly recommended), at minimum before monthly verification deadline
Users	Court (Full Access), Court (Enhanced CJ), Regional (Verifier)
Criticality	High -- unconfirmed bookings cannot be exported for payment; unconfirmed sittings are excluded from MI

Note: Accuracy of confirmation directly affects payment correctness. The training documentation emphasises that "the accuracy of the payment schedules sent to Liberata is highly dependent on the checking that goes on here."

Flow 4 -- Absence & Vacancy Management (Courts / RSU → JI)

Absence recording triggers a multi-step workflow involving court staff, RSU judicial teams, and vacancy/booking management. This is an internal JI workflow with human actors at each step.

Actors	Court staff (requesters), RSU / Judicial Team (approvers), Court staff (vacancy decision)
System	JI (Absences, Vacancies, Fee-paid Bookings screens)
Data	Absence type, dates, NTBF status, vacancy requirements, fee-paid judge allocations, booking confirmations
Mechanism	Multi-step approval workflow within JI UI. Email notifications at each stage.
Frequency	Event-driven
Criticality	High -- drives vacancy creation, fee-paid bookings, and downstream payments

Flow 5 -- Fee-Paid Payment Export (JI → JFEPS → Liberata)

This is the most operationally critical integration flow. JI generates payment files from confirmed fee-paid bookings and routes them through a human approval chain to the finance system and payment processor.

Source	JI (Payments screen)
Destinations	JFEPS (finance system), Liberata (payment processor)
Data	Judge details, payroll numbers, court codes, sitting dates, session types (full/half day), booking IDs, work types, fee amounts, London weighting
Format	JFEPS-compatible Excel file
Mechanism	JI validates data (dates, court codes, booking IDs) → generates Excel → emails to Payment Authoriser → authoriser reviews and forwards to Liberata → authoriser uploads to JFEPS
Frequency	Weekly
Users	RSU / Judicial Team (generates schedule), Payment Authoriser (reviews and forwards)
Criticality	Critical -- Crown Courts rely on this as the only mechanism to pay fee-paid judges without manual individual payments

Note: JI does not hold bank details or process payments directly. Sensitive financial data remains in JFEPS and Liberata. Double-submission is prevented by tracking which bookings have been exported.

Flow 6 -- Payment Reconciliation (JFEPS → JI)

After payments are processed, finance users reconcile the results back into JI to track which payments succeeded, which are pending, and flag discrepancies.

Source	JFEPS / Finance System (payment confirmations)
Destination	JI (Payment Reconciliation screen)
Data	Payment status (paid / pending / queried), reconciliation notes, discrepancy flags
Mechanism	Finance users manually check JFEPS payment confirmations, then flag payments as reconciled in JI. No automated data feed from JFEPS back to JI.
Frequency	Ongoing as payments are processed
Users	Finance / Payment Authoriser
Criticality	Medium -- prevents double-payment and surfaces discrepancies

Gap: Reconciliation is entirely manual. There is no automated feed from JFEPS back into JI. Finance users must cross-reference two systems.

Flow 7 -- Management Information & Reporting (JI → DA&I)

JI is the primary source of sitting day data for Civil, Family, and Crown Courts. DA&I extracts this data for management information, performance reporting, and strategic decision-making.

Source	JI (Reports screens)
Destination	DA&I; team systems, senior leadership, ministers
Data	Sitting day summaries, judicial utilisation, vacancy analysis, booking analysis, absence/official business analysis, jurisdictional splits, work type distributions
Format	Excel and PDF exports from JI report screens
Mechanism	Export-based -- users run reports in JI, copy/paste or download to Excel/PDF. DA&I; then transforms and aggregates. Manual extraction via spreadsheets also used.
Frequency	Aligned to reporting cycles (monthly, quarterly, annual)
Users	MI / Reporting Users, DA&I; analysts
Criticality	High -- ministers require performance reporting across jurisdictions; JI is the primary data source for courts

Gap: Tribunals data is not captured in JI. Tribunal sitting data is collected manually via spreadsheets managed by different Chamber Presidents' Offices, leaving a significant gap in cross-jurisdictional reporting.

Flow 8 -- Notifications & Communications (JI → HMCTS Email)

JI uses HMCTS email infrastructure as a transport layer for operational notifications, itinerary distribution, and payment file delivery.

Source	JI (various screens)
Destination	HMCTS email infrastructure → judges, court staff, RSU, Payment Authorisers
Mechanism	Automated email from JI. Some emails are sent immediately on action; others (e.g. booking acknowledgements) are batched via an overnight process.
Frequency	Event-driven
Criticality	High -- operational communications depend on email delivery

Email Triggers

Trigger Event	Recipients	Content
Booking created	Fee-paid judge	Booking confirmation with dates, court, work type
Booking cancelled / rejected	Impacted judge and court staff	Cancellation notification
Absence confirmed	Judge	Absence acknowledgement
Itinerary updated	Judge and relevant staff	Updated itinerary
Payment schedule generated	Payment Authoriser	JFEPS-compatible Excel file attached
Sitting/booking changes	Court staff	Alerts within system and optionally via email

Key Observations

1. **No API integrations exist.** Every integration is either manual data entry, file-based export (Excel/PDF), or email. This limits automation and introduces data quality risks from manual transcription.
2. **The payment flow is the most critical end-to-end integration.** It spans four steps (confirmation → export → authorisation → payment) with human checkpoints at each stage. Any delay in court confirmation cascades into delayed payments.
3. **eLinks integration is aspirational, not operational.** The SRS records it as a non-functional requirement, but no automated data exchange is implemented today.
4. **Reconciliation has no return feed.** Payment outcomes from JFEPS are not automatically reflected in JI. Finance users must manually bridge the two systems.
5. **Tribunals are a blind spot.** JI has no integration with Tribunal listing or scheduling systems. Extending coverage to Tribunals (Employment, Immigration & Asylum, SCS) is a stated strategic priority.
6. **Future integration pressure.** The Actuals programme and Scheduling & Listing (S&L) reforms both require JI data. The current export-only model will not scale to support these needs.
